

Switchgear Wireless Temperature Measurement Device Instruction Manual

Switch cabinet wireless temperature measurement device

1. Product Overview This

product is a new concept of wireless temperature measurement device for switch cabinets, with powerful functions, suitable for 3-35KV

Indoor central cabinets, handcart cabinets, fixed cabinets, ring network cabinets and other switch cabinets.

This product adopts the intelligent control of single-chip microcomputer, can measure the temperature of the busbar contacts wirelessly, can be configured with 3-point temperature measurement, 6-point temperature

measurement, 9-point temperature measurement, 12-point temperature measurement, etc. The temperature of the contact point can be set, and the over-temperature alarm output can be set. It can be equipped with 2-way temperature and humidity

monitoring in the cabinet, collect the temperature and humidity in the cabinet in real time, and automatically adjust the temperature and humidity environment in the cabinet according to user settings, with heating and dehumidification functions. It can

be equipped with real-time power parameter information, such as three-phase voltage, current, zero-sequence current, active power, reactive power, apparent power, power factor, frequency, active energy, reactive energy, etc. Optional real-time

monitoring switch input status signal. The RS485 communication interface of this product enables the device and other equipment in the substation to form a real-time microcomputer error-proof monitoring system. This product adopts unique anti-

jamming design and industrial-grade electronic components, with strong anti-jamming ability and high reliability. In addition to the above series of standard configuration products, the company can also customize products with different functional

combinations according to user requirements to meet the diverse needs of users

Second, technical

3. Function description

Wireless contact temperature measurement function: This device

has a temperature measurement function, the temperature measurement sensor is a strap type, and the standard length of the strap is 34 cm; according to the strap contacts, it can be divided into 3-point temperature

measurement, 6-point temperature measurement, 9 Point temperature measurement, 12-point temperature measurement, each 3 straps are installed on the upper and lower contacts of the circuit breaker or the busbar copper bars,

spectively, A, B, C three-phase straps are yellow, green, red three straps; The belt has its fixed contact address, which corresponds to the address on the host of the device, and communicates with the host to upload the real-time

temperature measured to the host of the device

The temperature measurement range of the strap is -20°C~120°C. When the contact temperature exceeds 70°C (factory setting value), install

Set the overheat alarm indicator light on, and the overheat alarm relay contact closure output.

Communication function

The device can be equipped with RS485 communication interface, modbus protocol, which can transmit real-time temperature and humidity values, contact temperature monitoring values, real-time power data, switch

status information, heating, disconnection, exhaust, overheating and other status parameters.

Device setting menu function description

yAfter power on, enter the temperature and humidity measurement interface in the cabinet: press the "up" and "down" keys to switch other interfaces

ÿLong press the "OK" key to enter the password "0001" to enter the main menu, and press the "up and down" keys to select the menu,

"SET" key: long press and enter the password to enter the main menu, after the menu value is modified, press this key to save the modification;

"BS" cancel key: in the menu, press this key to return to the previous menu and exit the main menu; "y" up key: number increase key and page turn query key;

- " down key: number reduction key, pape-turning query key and menu password setting shift ke

7. Contact temperature measurement: It can be equipped with 3-point temperature measurement, 6-point temperature measurement, 9-point temperature measurement, 12-point temperature measurement, etc.

Load nowar supply: AC220V+10% 50HZ 2 Dowar consumption of the device: 015VA 3 Dialactric strength

8. Measurement accuracy: Temperature ±2ÿ Humidity ±5%RH. 9. Multi-electricity measurement (optional): measure three-

indicators 1. Working voltage: device power supply: AC/DC90-260V.

ÿAC2000V between the shell and the terminal. 4. Insulation performance: more than 100Mỹ between the shell and the terminal. 5. Communi

PS485 interface MODBLIS protocol fectory address can be set, have rate 4800/0800. 6. Temperature and humidity control range in the rahinat

phase voltage, current, power, power factor, electric energy, etc.

(optional): temperature -20ÿ~99ÿ, humidity 0%RH~95%RH

10. Working environment: normal working temperature -20 y-70 y, annual average humidity y 95%. 11. Anti-electromagnetic interference performance: in line with the standard requirements of

IEC60255-22.

12. Display mode: large-size blue-screen LCD display.

2

ÿMenu character introduction:

character	text description code	Character	text description mod
CodE	password	nod	Protocol settings
SEL	Set set disp	Addr	Addr mailing address
d 15P	display	PAr	Par verification method
	Circ cycle display	PARA	Baud baud rate setting
PAUS	Paus toggle display	ALAr	Alar Alarm Settings
LEd	Lcd backlight power saving time	U-H	UH voltage upper limit alarm
ELEr	Cler energy clear	U-L	UL low voltage limit alarm
па	NO is not cleared	I-H	IH current upper limit alarm
962	Yes OK to clear	I-L	IL Current lower limit alarm
ΙпΡΓ	Inpt input settings	ALE	Alt alarm delay setting do switch
PF	PT Voltage Multiplier	do	output dot1 first channel out
٢	CT current magnification	dofl	delay setting do1u first channel out type setting
L INE	Line connection	da IU	
50	SU voltage range	Ro	Ao analog output
58	SA Current range conn	ApHI	The upper limit of the first transmission output of AoH1
Conn	Communication setting	AaL I	The lower limit of the first transmission output of AoL1
LEd	Led Cabinet Lighting Control	AaUI	AoU1 first channel transmission type setting
Г І-Н	T1-H first high temperature exhaust setting	LD-J	T-cd contact temperature measurement address setting
Н-5 Л	T2-H Second high temperature exhaust setting	F-AL	T-AL contact over temperature threshold setting
Г I-L	T1-L 1st circuit low temperature heating setting	Conf	Cont controls output settings
1-57	T2-L Second low temperature heating setting	НоГ	HOT Manual Heat Control Settings
HI-H	H1-H 1st dehumidification setting	HHAL	YYAL voice anti-mistake prompt start and stop settings
H5-H	H2-H 2nd dehumidification setting	PP- C	YYRT infrared human body sensor start and stop settings
UP	UP Temperature and humidity overrun	Πο	ON function is on
doUn	threshold setting down Overrun hysteresis setting	oFF	OFF function off

vContact temperature measurement strap address setting and temperature measurement over-temperature alarm setting

ÿManual heating, human body induction and voice anti-mistake prompt control: enter the menu as above (press the OK key to save after modification)

4. Terminal description

after wiring description:

Wiring:

Installation size:

1. The working power supply of the device is AC220V or AC/DC90-260V optional.

2. When performing the withstand voltage test on the switch cabinet, be sure to disconnect all terminals on the device to avoid damage to the device.

3. The RS485 communication line is strictly prohibited to be bundled with other lines with strong electromagnetic interference, and should be routed separately.

Otherwise, it may cause the device temperature and humidity acquisition control failure and remote communication failure.

4. The device failure and accessories damage caused by the above reasons are not within the scope of our company's warranty.

strap sensor installation

(1) 3 point temperature measurement: to the first pair of straps (1/20) with the same contact numbers to the contacts on the circuit breaker, and the temperature measurement contact surface of the straps is close to the contacts; (2) 6 point temperature measurement: the the second pair of straps (4/56) with the same contact numbers to the contacts of the circuit breaker, and the temperature measurement contact surface of the straps is close to the contacts; (3) 9 point temperature measurement: the the third pair of straps (7/89) with the same contact numbers to the cooper-brand connector accessionles of the upper bus bar, and the contact surface of the strap for temperature measurement is the toring of straps with the same contact numbers (10/11/2) to the cooper-brand connector accessionles of the upper bus bar, and the contact surface of the strap for temperature measurement is the fourt pair of straps with the same contact numbers (10/11/12) to the cooper-brand connector attachment of the lower busbar, and the contact surface of the strap for temperature measurement is the fourth pair of straps with the same contact numbers (10/11/12) to the cooper-brand connector attachment of the lower busbar, and the contact surface of the strap for temperature measurement is close to the cooper-brand connector attachment of the lower busbar, and the contact surface of the strap for temperature measurement is close to the cooper-brand connector attachment of the lower busbar, and the contact surface of the strap for temperature measurement is close to the cooper-brand connector attachment of the lower busbar, and the contact surface of the strap for temperature measurement is close to the cooper-brand connector attachment of the lower busbar, and the contact surface of the strap for temperature measurement is close to the cooper-brand connector attachment of the lower busbar, and the contact surface of the strap for temperature measurement is close to the cooper-brand connector attachment of the lower busbar, and the con

Strap-type temperature sensor probe
